

After unplugging the battery there is still a current sound on the motherboard

Before you change the battery, use your smart-phone to snap pictures of all the BIOS SETUP screens, to make a record of the current value of the settings. Or, "old-school" pencil-and-paper will work. After you change the battery, use BIOS SETUP to change the settings to match the images on your smart-phone.

Changed the thermal paste too. While I was reassembling the laptop, I was inserting the wires of the battery inside the right place and while inserting them the laptop sparked and smoke went up with a burning smell. The next day I took the laptop to a certified repair service they told me that the battery fried the motherboard.

Under normal "power off" conditions the mobo still receives power from the psu and some control circuits remain active. Additionally, the filter capacitors in the psu retain a charge after the psu ...

Just because the OS is shut down, does not mean the motherboard and psu are not still active. Mostly the psu goes into a Standby mode, sort of like how a pc goes into sleep mode, and things like the 5v rail for USB ports and the 3.3v rail for the motherboard logic circuitry will stay on until you either pull the plug or turn the psu physically off by its switch.

Sorry. if it helps, it doesn't sound like you did anything wrong, and there are lots of safeguards that to prevent accidents, but flashing a rom is always a little risky. ... So one last resort is to power up unplugging the power to the GPU. Let it go through the motions of failing. ... Find the CMOS Battery. Remove it from the motherboard Wait ...

The motherboard itself is bad - If none of the above works, you didn't accidentally damage any wires while inside the unit, and the battery you just received is not bad, then your motherboard is bad. On some of these older units there is a tiny board just ...

There is very little risk of actually breaking the Steam Deck through an SSD replacement. You technically don't even have to unplug the battery in the first place (I highly recommend it, though). Every time you plug the battery back into the Steam Deck's motherboard the little power led next to the power button will light up briefly.

My ASUS UX31A won't start anymore after a fan cleaning session. At first, after reassembly, there were the power LED, F2 LED, and Caps Lock LED all lighted up but with a ...

Ensure that the battery is fully charged. Remove the battery and disconnect the AC Adapter; Hold the power button down for 15 - 20 seconds to discharge the Static Electricity. Unplug ALL of the wiring coming from the case front I/O and switches to the motherboard, after unplugging and switching off the PSU of course. Then, plug the PSU back in and switch it back on. Now, attempt to start the system by jumping the two power pins that the switch from the front of the case WAS previously connected to.

Hi! I've been having problems with my current machine for quite a while now, got it from a relative back in November. The BIOS settings keep getting cleared everytime I cut power from it (unplug it from an outlet). I've replaced the CMOS but to no avail. I've also flashed the BIOS to the latest...

While working on their "insides", unplug the desktop computer, and remove the battery for laptops. Always. Some desktop computers mainboards" have an LED which shines to emphasize power is active. Even for ~1 minute after unplugging the LED will remain lit.

Get in the attic, and search for another battery operated device up there. There was probably nothing wrong with the old hard wired one, you might have not known about the one in the attic. As a side note the other chirper will quieten, after the battery is fully drained, if you can wait long enough.:devil3: ED

I have a Dell D600 laptop. It recently refused to start when I pressed its on button. The button blinked for a few seconds, as did the three symbols to its left, which look like padlocks containing a 9, an A and a ?, respectively.. A couple of times, I removed the battery, waited a few seconds, then put it back in, and tried again.

It made sense that the CMOS battery died so I went ahead and bought a new one, nope, still resetting. I looked online for more info and I've seen a few people mention to unplug every cable from the motherboard and plug it back in, incase one isn't connected right. So I did.

I recently swapped out my cpu and gpu and updated my BIOS to a new version and every time I flip the power switch or unplug from the wall my BIOS resets. I did switch cmos battery but that is the only thing I have

But the laptop is still losing % battery after shut down + unplug the power. If someone has a similar issue, please help me this. I have contacted ASUS and ASUS told me to send my laptop back to them, but I don't think the battery's fault. Because the previous ASUS laptop I tested is happening like the one currently I have.

Step 4: Remove the CMOS battery. After getting a new CMOS battery (as long as the model number is the same, the button battery manufacturer does not matter.), you can finally move on to the replacement work. Press the battery holder clasp outwards, and remove the battery when it pops up or press down on one end of the battery.

Hi have an e442 notebook, 2 years old, every time i boot, time and date resets, and sometimes have a blank screen, that clears after about 10 mins, but other than that everything ok. replaced cmos battery, but still the ...

If there is no swelling, disconnect the battery, then reconnect. This simple reseal might solve the problem. If it does not, remove the battery from the equation. Disconnect it again, connect external power, and try to turn it on now. Still no power? This isn't a battery issue. If you get power without the battery connected, replace it.

There is a small button on the battery for "Emergency cutoff" of the battery power, in case water is spilled on the laptop. But the manual says: "Do not cut the battery power under normal conditions. This may result in data loss or a product malfunction."

There are some comments on the question Are there any modern diesel engines that require electricity to continue running? suggesting that disconnecting the battery while the car is running can damage electrical components.. In the 1960's to 1980's alternators had voltage regulators, once the car was running the battery was just a load, like a light bulb.

The battery has an estimated life of three years when the Intel® NUC is not plugged into an AC power source. When the computer is plugged in, the standby current from the power supply extends the life of the battery. BUT, do you really want to work on it while it is powered? There is of course always chance of a short or other problem.

As long as you're working on your desktop, swapping the CMOS battery is a simple matter of removing the side panel, locating the battery, and swapping it out with a suitable replacement. It's no different than changing the batteries in your TV remote; just make sure to get the right battery and place it in the right orientation.

Hello, and let me get into the problem, or the question I might say. All my components work pretty well, except MoBo I guess. Problem is that whenever the PC turns on, there is not a problem about keeping it up, no puns intended, but when I turn it off and try to power it on once again after like one day, BIOS gives me the "yo battery ain workin, keep it changed ...
