Uninterruptible Power Supplies, or UPS, provide backup power during a power outage or fluctuation in the main power supply. UPS systems typically consist of a battery, charger, and inverter. When the main power supply is interrupted, the UPS seamlessly switches to battery power to maintain the operation of connected devices.

The backup circuit to charge your type of battery and an embedded circuit to possibly route power back into the main circuit when the main power is off. Optional. Build a trigger into the circuit that connects to the Raspberry PI's I/O system to send you and email, text message, make a phone call, trigger an alarm or turn of your kitchen lights.

An uninterruptible power supply (UPS) is a power supply circuit that provides backup power during power outages or fluctuations. It typically consists of a battery, charger, and inverter. UPS systems are essential in critical applications where even a short power loss can result in data loss or system failure.
