It runs fine off either battery or ac adapter. I was thinking perhaps the ac adapter is faulty, but when I ran the HP UEFI Hardware Diagnostics with the laptop plugged in, it said that the battery has a blown fuse. However! The Hardware Diagnostics log file only says &quot;battery fuse may be blown,&quot; which doesn't sound so confident.

UPS Tech cycled battery cabinet breakers and blew every fuse in each cabinet - Anyone have insight into why this would happen? So I do building maintenance for a data center and the other day we had a testing company come out to replace the hammers in the breakers for each battery cabinet for one of our UPS. UPS was powered down and input breaker was opened. After the ...

I think it's the same thing as the video, and what "alcatraz" reported: ie: you can test the fuse in your hand, or even on the car & it test fine (usually). Or maybe it's more accurate to say that the fuse has continuity. Perhaps the fuse may have some internal issue that causes the problem. The mechanic in the video seemed to have seen this ...

One of the things that people often forget is a fused spur. So it might be a fuse holder with a switch like this one, and you would switch it off. Or it might be just a fuse holder where you would just get a screwdriver and take the fuse out. How do you know if the power, what's still got power on and what hasn't? Hopefully you should see, but ...
