As a general rule, the higher the voltage, the more charge the battery has. However, the relationship between voltage and state of charge is not always linear. For example, a fully charged 12-volt lead-acid battery will have a voltage of around 12.8 volts, while a partially discharged battery may have a voltage of 12.2 volts or less.

This will lead to the notion of steady current, which, in practical terms, means a current that is constant in time. Also, as might be expected, because now we discuss both voltage and current, the various aspects of circuit theory such as Ohm's, Kirchhoff's and Joule's laws, and their relation to the electric field are established.
