However, the potential drop ($V_1 = Q/C_1$) on one capacitor may be different from the potential drop ($V_2 = Q/C_2$) on another capacitor, because, generally, the capacitors may have different capacitances. The series combination of two or three capacitors resembles a single capacitor with a smaller capacitance. Generally, any number of capacitors connected in ...

When the switch "S" is closed, the current flows through the capacitor and it charges towards the voltage V from value 0. As the capacitor charges, the voltage across the capacitor increases and the current through the circuit gradually decrease. $V = Q / C$, as well as for each one individually: $V_1 = Q / C_1$, $V_2 = Q / C_2$, etc.. Once again, adding capacitors in series means summing up voltages, so: $V = V_1 + V_2 + \dots \rightarrow Q / C = Q / C_1 + Q / C_2 + \dots$. We can divide each side by Q, and then we get the final form of the capacitance formula (or its inverse, precisely speaking):
