OverviewApplicationsCharging and dischargingActive componentsTypesAlternativesResearchSee alsoA rechargeable battery, storage battery, or secondary cell (formally a type of energy accumulator), is a type of electrical battery which can be charged, discharged into a load, and recharged many times, as opposed to a disposable or primary battery, which is supplied fully charged and discarded after use. It is composed of one or more electrochemical cells. The term "accumulator" is us...

When the battery is charged, the chemical reactions occur in reverse, allowing the battery to store energy. One common type of rechargeable battery is the lithium-ion battery. It is widely used due to its high energy density and long lifespan. However, overcharging a lithium-ion battery can lead to detrimental effects.

2 ¶ It is done using an isolator that ensures that when the engine isn't running, only the secondary battery is used. The two batteries are also connected to the vehicle's alternator. This means when the vehicle starts, both batteries will recharge. But the isolator will give priority to the primary battery.

Secondary battery. Secondary batteries can also be known as rechargeable batteries. The chemical reaction that takes place can in theory be reversed and this will put the cell back to its original state. They can be used in two different ways, firstly they can be used as a storage device. They are connected to the main energy source and will ...
