design is the selection of dc-link capacitors. The capacitors are a sensitive element of the inverter and a common source of failures. Thermal stress occurs because of losses on the dc-link capacitor's equivalent ...

When voltage is applied current flows through each of the RC circuits. The amount of time required to charge the capacitor is dependent on the CxR values of each RC circuit. Obviously the larger the CxR the longer it will take to charge the capacitor. The amount of current needed to charge the capacitor is determined by the following equation:

The switching procedure is ...

Take care when using input inductors as they will affect input capacitor selection. When output current transients are involved the key point to keep in mind is that the electrons have to come from the input of the regulator. Bulk capacitors control the voltage deviation at the input when the converter is responding to an output load transient. The higher the capacitance, the lower the ...
