A capacitor is an electrical component that stores energy in an electric field. It is a passive device that consists of two conductors separated by an insulating material known as a dielectric. When a voltage is applied across the conductors, an electric field develops across the dielectric, causing positive and negative charges to accumulate on the conductors.

The main purpose of having a capacitor in a circuit is to store electric charge. For intro physics you can almost think of them as a battery. . Edited by ROHAN NANDAKUMAR (SPRING 2021). Contents. 1 The Main
