failures of capacitor elements (internally fused banks) units or (externally fused banks) . The method of fusing impacts how the capacitor units are arranged in groups and strings. Overall, capacitor banks are protected by a combination of fuses, which remove the failed unit or element, and protective relays, which alarm and trip the bank offline.

Electrolytic filter capacitors are frequently responsible for static converter breakdowns. To predict these faults, a new method to set a predictive maintenance is presented and tested on two types of converters. The best indicator of fault of the output filter capacitors is the increase of ESR (equivalent series resistance). The output-voltage ripple ΔV ...
