Capacitors are only short circuits when you consider the "small signal" component after you found the DC linearized point. So capacitors are open when considering the DC component, then shorts (or at least small negative imaginary impedance) when solving for the non-DC small signal response. SCB energization can cause considerable overcurrent and overvoltage transients. The SCB draws a large amount of high-frequency oscillatory current from the network and thus results in a transient overvoltage on the corresponding bus [12], [13], [14]. The transients can intensify when there are more SCBs in-service [5] addition, when a short circuit fault occurs ...
