Do not exceed the specified limits. (3) Do not allow other parts or components to touch the capacitor during soldering. 2.5 Reflow Soldering for Chip Capacitors

The temperature rise can be suppressed by reviewing how to install the motor. In particular, the size and material of the heat sink to be attached changes the temperature rise of the motor as shown below. If the size of the heat sink is increased like L · O or N · P, the temperature rise can be suppressed.

Figure 1.

Environment factors are also needed to consider on how to select capacitors. If your product will be exposed to an environment temperature of 100"C, then do not use a capacitor that is only rated at 85"C. Likewise, if the minimum environment temperature is -30"C, then do not use a capacitor that can only withstand -20"C temperature.
