AC current through a capacitor dominates the heat generated by a capacitor. In the case of a voltage doubler, the AC component of the voltage on the capacitor is the ripple voltage. The frequency of the AC signal is another factor, where a higher frequency will generate more heat. And finally, a portion of the current the ...

In this project, we will show how to build a voltage doubler circuit. A voltage doubler circuit is a circuit in which the output voltage is double the amplitude of the input voltage. This voltage doubling effect is achieved through the use of capacitors. We use individual capacitors to charge up to the input voltage. The first capacitor ...

A voltage multiplier is a specialized rectifier circuit producing an output that is theoretically an integer time the AC peak input, for example, 2, 3, or 4 times the AC peak input. Thus, it is possible to get 200 VDC from a 100 V_{peak} AC source using a doubler, and 400 VDC from a quadrupler. Any load in a practical circuit will lower these voltages.
