ALTHOUGH POWER circuit breakers are designed primarily to interrupt heavy inductive short-circuit currents, system growth in recent years has produced a greatly increased requirement of interrupting relatively lighter currents associated with the switching of capacitive kilovolt-amperes. This capacitive kilovolt-ampere requirement has manifested itself in long-distance high-voltage ...

Capacitors in circuit breakers

high-voltage circuit breakers are designed with a single interrupter (per pole), without parallel or grading capacitors. 363-550kV circuit breakers are designed with two interrupters (per pole) and are equipped with coupling or grading capacitors and pre-insertion resistors as required. Pre-insertion resistors are used to reduce over voltages that

By using the Grading capacitor in Circuit Breaker, over-voltage stress can distribute across the breaks and it will save the Breaker from failure. Use of Grading Capacitor in Circuit Breaker. Grading capacitors are generally used in 400KV and above voltage level circuit breakers. In the 765KV Circuit breaker, always grading capacitors are used.
