Lithium-ion batteries (LIBs) have gained substantial prominence across diverse applications, such as electric vehicles and energy storage systems, in recent years [[1], [2], [3]]. The configuration of battery packs frequently entails the parallel connection of cells followed by series interconnections, serving to meet power and energy requisites [4].

When this series combination is connected to a battery with voltage V, each of the capacitors acquires an identical charge Q. To explain, first note that the charge on the plate connected to the positive terminal of the battery is (+Q) and the charge on the plate connected to the negative terminal is (-Q). Charges are then induced on the other plates so that the sum of the ...
