A series circuit's defining characteristic is that all components in a series circuit have the same current flowing through them. There is only one path for the current to flow. In the circuit from Figure 2, the current (I) flows clockwise to complete a full loop from the positive battery terminal back to the negative terminal and then through the battery following the path 1-2-3-4-1.

While it is often debated what the best way to connect in parallel is, the above method is common for low current applications. For high current applications, talk to one of our experts as your situation may need a special configuration to ensure all of the batteries age at as similar as possible rates. ...

When this series combination is connected to a battery with voltage V, each of the capacitors acquires an identical charge Q. To explain, first note that the charge on the plate connected to the positive terminal of the battery is (+Q) and the charge on the plate connected to the negative terminal is (-Q).
