There are several mature energy storage technologies, including chemical battery energy storage, pumped storage and compressed air energy storage (CAES) [4, 5]. Among them, chemical battery energy storage technology is the most popular one, but the investment and recycling cost, as well as potential environmental problems limit its large-scale application.

Compressed air energy storage (CAES) and its associated technologies were introduced and thoroughly discussed in Chapter 6. As mentioned there, one of the subcategories of CAES that is so promising for the future due to the capability of multigeneration of heat, cold, and electricity is the concept of Trigenerating-CAES (T-CAES), which may also be called ...
