The heart of an electric vehicle (EV) is its battery pack, and the module cell connection system is the infrastructure that connects the individual cells to the high-voltage output of the pack. Without either functioning properly, an EV may experience a host of issues - from poor performance to an outright failure.

It's pretty clear that a single cell high 120kWh pack does not reach the size capacity limit on the CT floor (which is the pink box around the cells), given that we now know that the battery can also extend under the vault cover in the rear (which is actually a bit further back than the pink box), where the "hump" known as the penthouse also is housed.

Remove any plastic protector over the battery connector. Caution: Do not remove the plastic cover from around the battery. This is necessary for proper connection and removing it may cause serious bodily injury or damage. Carefully insert the new battery pack into the panel.
