When multiple capacitors are added to a circuit in series, you can find the total capacitance using this formula. $\frac{1}{C_T} = \frac{1}{C_1} + \frac{1}{C_2} + ... + \frac{1}{C_n}$ Thus, the reciprocal of the total capacitance of a set of capacitors connected in parallel is equal to the sum of the reciprocal of the capacitance of each one.

Capacitors in Series Formula capacitors in series formula. The formula to calculate the total capacitance (C_{total}) when capacitors are connected in series is: $C_{\text{total}} = \frac{1}{\frac{1}{C_1} + \frac{1}{C_2} + ... + \frac{1}{C_n}}$ Where: C_{total} is the total capacitance of the series connection.

Thus, the total capacitance is less than any one of the individual capacitors' capacitances. The formula for calculating the series total capacitance is the same form as for calculating parallel resistances: When capacitors are connected in parallel, the total capacitance is the sum of the individual capacitors' capacitances.
