There are only two types of charge, which we call positive and negative. Like charges repel, unlike charges attract, and the force between charges decreases with the square of the distance. The vast majority of positive charge in nature is carried by protons, while the vast majority of negative charge is carried by electrons.

Further Reading; You may recall from general chemistry that it is often convenient to describe chemical reactions with energy diagrams. In an energy diagram, the vertical axis represents the overall energy of the reactants, while the horizontal axis is the "reaction coordinate", tracing from left to right the progress of the reaction from starting ...
