A good way to store thermal energy is by using a phase-change material (PCM) such as wax. Heat up a solid piece of wax, and it'll gradually get warmer--until it begins to melt. As it transitions from the solid to the liquid phase, it will continue to absorb heat, but its temperature will remain essentially constant.

Sensible heat thermal energy storage materials store heat energy in their specific heat capacity ( $C_p$ ). The thermal energy stored by sensible heat can be expressed as  $Q = m \cdot C_p \cdot \Delta T$  where  $m$  is the mass (kg),  $C_p$  is the specific heat capacity ( $\text{kJ} \cdot \text{kg}^{-1} \cdot \text{K}^{-1}$ ) and  $\Delta T$  is the raise in temperature during charging process. During the ...

Heating up renewable energy storage. Scroll down. ...
