$J_f$  (kg m<sup>2</sup>) represents the moment of inertia of the flywheel rotor body, and  $\omega_f$  (rad/s) is the rotational angular velocity of the flywheel rotor. Based on Eq. (1), it can be deduced that the energy storage capacity of the FESS is determined by its moment of inertia and mechanical angular velocity and this can be adjusted to improve the FESS's overall performance.

Superconducting energy storage and supercapacitor energy storage essentially use electromagnetic fields to store energy, and there is no conversion process of energy forms. The Torus Flywheel uses electricity from the grid or a renewable energy source, like solar panels or wind turbines, to spin a heavy metal disc using its motor-generator, storing kinetic energy. This kinetic energy is later converted back into electricity for businesses and utility providers to use as the disc gradually slows down.
