Lithium-sulfur battery is a new type of lithium secondary battery with non-toxic and low-cost sulfur monomer as the positive electrode and lithium metal as the negative electrode, which has high theoretical discharge capacity (1675mAh/g) and high quality energy density (2600 Wh/kg) and is considered as one of the most promising choices for ...

Following the discovery of the Li||TiS 2 battery chemistry by Whittingham in the 1970s 1, the Li metal anode has been sought after for its high theoretical capacity and low redox potential 2,3 ...

Lithium sulfides have shown the highest Li ionic conductivity (≥ 1 mS/cm) in the family of inorganic electrolytes for lithium-ion batteries, which is comparable with that of liquid ...

A lithium ionic conductor, $\text{Li}_{1.3}\text{Al}_{0.3}\text{Ti}_{1.7}(\text{PO}_4)_3$ (LATP), is introduced as a coating material on the surface of Mg-doped LiCoO_2 to improve electrochemical performances for high-voltage (4.5 V) lithium ion batteries. Structure, morphology, elemental distribution, and electrical properties of the materials are thoroughly characterized by SEM, TEM, EELS, EDS, ...

The application of high voltage cathode electrode materials is an effective way to increase the energy density of batteries. However, the development and design of a stable electrolyte at high voltages needs to be ...

Are Polymer-Based Electrolytes Ready for High-Voltage Lithium Battery Applications? An Overview of Degradation Mechanisms and Battery Performance. Maria Angeles Cabañero Martínez, ... Depending on the content of liquid components, composite polymer electrolytes (CPEs) containing non-conductive fillers can be classified as SPEs and GPEs, ...

A dielectric electrolyte composite with high lithium-ion conductivity for high-voltage solid-state lithium metal batteries. Nat. Nanotechnol., 18 (2023), pp. 602-610. ... One-step calcination synthesis of interface-coherent crystallized and surface-passivated $\text{LiNi}_{0.5}\text{Mn}_{1.5}\text{O}_4$ for high-voltage lithium-ion battery. Nano Res., 17 (2023), pp ...

constituting a charge transfer barrier for the parasitic interactions between the electrolyte and positive electrode, ...

The solid-electrolyte interface (SEI), well connecting the microscopic behavior of the electrolyte and the macroscopic performance of the battery, plays an important role in developing the low-temperature and high-voltage electrolytes [11] nstructing a robust SEI has become the main modulation method for electrolyte design [12].However, some graphite ...

Compared to the PA electrode, the PAZ electrode exhibits high crystallinity in the (0 1 0) plane and high conductivity. Additionally, after PAZ dedoping, the electrolyte concentration increases while free water molecules production decreases. This allows the Zn//PAZ battery to achieve a stable 3000 cycles at an ultra-high voltage of 2.4 V.

Lithium-metal batteries (LMBs) with a Ni-rich high-voltage cathode enable the delivery of a high energy density. However, a persistent challenge lies in the instability of the electrode-electrolyte interface leading to ...

Conductive carbon additives are important constituents of the current state-of-the-art Li-ion battery cathodes, as the traditional active cathode materials are characterized by too low electronic conductivities. In high-voltage Li-ion batteries, these additives are subject for anion intercalation and electrolyte oxidation, which might cause changes in the conductive carbon ...

Batteries utilizing high-capacity Li and Si anodes, high-voltage and high-capacity cathodes, or a combination of these, are effective strategies for pursuing higher ...

Abstract Research on the chemistry of high-energy-density transition metal oxide cathodes (TMOCs) is at the forefront in the pursuit of lithium-ion batteries with increased energy density. As a critical component of these cathodes, binders not only glue cathode active material particles and conducting carbons together and to current collectors but also play ...

The application of high voltage cathode electrode materials is an effective way to increase the energy density of batteries. However, the development and design of a stable electrolyte at high voltages needs to be further addressed. Herein, we developed a non-flammable dual-salt deep eutectic solvent (DES) as a safe electrolyte containing LiTFSI, ...

Carbon nanotubes, conductive poly(3,4-ethylenedioxythiophene)-poly(styrenesulfonate) binder, conventional carbon black additives, and their mixes are compared with each other in terms of their effect on LiNi_{0.5}Co_{0.2}Mn_{0.3}O₂ slurries. The electrochemical characteristics of cathode slurries were studied using cyclic voltammetry, electrochemical ...

LiNi_{0.5}Mn_{1.5}O₄/MCMB Li-ion batteries. Adv. Energy Mater. 8, 1701398 (2018).

Furthermore, as discussed above (sections 5.2 Capacity, 5.3 Voltage), the electrode mass and battery voltage can be determined in different ways, which makes it imperative to report how these values have been measured, ... TiS₂ has a high conductivity which may make it attractive for solid state batteries [181].

1. Introduction. Conductive carbon additives, such as acetylene black (AB) [1], [2], Super P (SP) [3], [4], [5], Super C [1], usually have relatively low surface area and pore volume and are often used during the preparation of battery electrodes to improve their electronic conductivity. Other high surface area carbon, for example, Ketjen black (KB) contains ...

High-energy and high-safety energy storage devices are attracting wide interest with the increasing market demand for electrical energy storage in transportation, portable electronics, and grid storage. 1, 2, 3 ...

The most deficient ionic and electronic transportation in the electrodes is the determining step in a high-rate battery, which will further lead to heterogeneity at the macroscale ... Although the high ionic conductivity of organic liquid ... Aside from the high voltage of 4.55 V that was achieved using La/Al coupling in a ...

The sodium-ion battery (NIB) is a promising energy storage technology for electric vehicles and stationary energy storage. It has advantages of low cost and materials abundance over lithium-ion ...

Gross et al. demonstrate a higher voltage molten Na battery operating at the low temperature of 110 °C. A molten salt catholyte and solid Na⁺ conducting separator enable cycling over 8 months, potentially promising a new generation of high-performance, low-temperature molten Na batteries for grid-scale energy storage.

Therefore, as a new generation of high-voltage PEs, meeting the following criteria is crucial: (1) Li⁺ conductivity and transference number: Exceptional ion transport capabilities help reduce concentration polarization, regulate Li⁺ flux, enhance battery rate performance, and minimize irregular growth of lithium dendrites. (2) Interface ...
