As of July 2015, a wide range of NEVs, including hybrid electric buses, electric buses, electric minibuses, government vehicles powered by new energy sources, fuel cell vehicles, electric taxis, electric logistics vehicles, and privately-owned new energy vehicles have been cumulatively deployed in these cities (Noussan et al., 2020).

In a typical battery, charged ions zip one way through a sea of other particles as the battery recharges, before racing back in the other direction to release the stored energy on cue. Back and forth the ions go, some getting diverted along the way, until the capacity of the battery is drained, and it loses energy too quickly to be of any use.
