Most EVs use lithium-ion batteries. These degrade over hundreds of charge/use cycles, becoming less effective in the process. However, drivers can expect upwards of 10 years or 100,000 miles of use - with reports of twice that distance - from an electric car. As such, the lifespan of an EV is not dissimilar to a conventional petrol or diesel model.

Using current and voltage introduces LOTS of uncertainties. Your calculations (and the ones in the answers which take your assumptions as correct) are WAY overestimated. You should take the starter motor power (usually 1-1.5 kW, that is still overestimated, if you consider the drop in battery voltage) and the time to start the car.

Stiesdal storage technologies (SST) is developing a commercial RTES system in Lolland, Denmark. 14 Another technology demonstrator was developed by The National Facility for Pumped Heat Energy Storage 36 and SEAS-NVE. 37 Researchers at Newcastle University explored a TES system with a capacity of 600 kWh (rated at 150 kW) and an efficiency of ...

Installing a wall box hastens the charging process, making it significantly quicker than it would otherwise be. Level 2 charging is also available at some workplaces and public charging stations. With this type of charging, you can charge a fully electric vehicle to 80% from empty in 4 to 10 hours. With a PHEV, Level 2 charging can take 1 to 2 ...
