I built a battery pack from 40 - 18650 lithium ion cells in parallel and use it every day. I connected a PCB to protect against short circuit, over charge and over discharge. It is used for relatively low current, 4 amps and less, but charges at as fast as 10 amps with no problems. For your project I would look at the electric bicycle group.

How many amperes of current is there if 10 batteries are connected in series

The series connection of two identical batteries allows to get twice the rated voltage of the individual batteries, keeping the same capacity.. Following this example where there are two 12V 200Ah batteries connected in series, we will have a total voltage of 24V (Volts) and an unchanged capacity of 200Ah (Ampere hour).

As a result of multiple cells being connected in series, as with the use of a battery holder or pre-made battery packs, voltage increases, but amperage does not, which remains constant. If you have 8 AA batteries (2.8 ampere-hours each) connected in series, then the electric current flowing through them is equals to 0.14 amps per hour.

If they are identical batteries with identical charge (an ideal assumption and not the case, but its safe to assume so hypothetically) then half the current will be drawn from both each such that the required 3A comes from 1.5A of each of the batteries - they can be seen as mutually exclusive in the way that the current from the 2nd battery ...

If your battery allows it, you can repeat the above steps to connect more batteries in series. You can wire three 12V batteries in series to create a 36V battery bank. Once again, just connect the negative terminal of your 2-battery series string to the positive terminal of the third battery.

The four batteries in parallel will together produce the voltage of one cell, but the current they supply will be four times that of a single cell. Current is the rate at which electric charge passes through a ...

Connecting batteries in series will increase the voltage and keep current capacity constant. When you connect batteries in series : $V_{total} = V_1 + V_2 + \dots + V_n$ (e.g. $1.5 + 1.5 + 1.5 = 4.5V$) Current capacity = lowest current capacity between batteries (e.g. 2A)
