Tutorial on how to calculate battery energy, with practical examples and on-line calculator. Menu. Mathematics and Science. ... which has the cell voltage of 1.2 V and current capacity of 2200 mAh. Step 1. Convert the battery cell current capacity from [mAh] to [Ah] by dividing the [mAh] to 1000: C cell = 2200 / 1000 = 2.2 Ah.

To find the value of the voltage source, simply measure the battery with nothing connected. Since there is no current (the current drawn by the voltmeter is so small that it can be ignored in this application) thru the resistor, the voltage across it is 0. The battery's open circuit voltage is therefore the voltage of the internal voltage source.

The electrical driving force across the terminals of a cell is known as the terminal voltage (difference) and is measured in volts. When a battery is connected to a circuit, the electrons from the anode travel through the circuit toward the cathode in a direct circuit. The voltage of a battery is synonymous with its electromotive force, or emf.

Ohm"s Law. The current that flows through most substances is directly proportional to the voltage (V) applied

to it. The German physicist Georg Simon Ohm (1787-1854) was the first to demonstrate experimentally that the current in a metal wire is directly proportional to the voltage applied: [I propto V . label{20.3.1}]

Measure battery lifetime with a voltage divider. Enter the values of current, Ib (A) and internal resistance, Rb (O) to determine the value of battery voltage, Vb (V).
