But lithium ion (and lithium polymer) batteries can be discharged below 3.3V. Most of the time, this is just a red herring. In reality, a lithium ion battery at 3.4V is pretty much fully discharged. You can continue to discharge it to a lower voltage, but the battery life extension gained by ...

One last note, an ebike battery is one of the biggest battery packs you will likely ever buy in your life. If you can accomplish your goals with a 48V or 52V pack, either one of those can power an inverter in a disaster to provide 120V AC to your home. If you use 4P of common 10A cells (40A), and the pack is 52V, then... $40A \times 52V = 2100W$. That ...

A 3.7-volt lithium battery usually stops working at 3.4 volts, so recharge or replace your battery if it is approaching this level. 5. Perform a load test with alkaline batteries for the most accurate result. A load test measures the battery's power when it's in use. Higher-end multimeters have 2 load settings, 1.5V and 9V. For a AA, AAA, C, or D battery, set the voltage ...
