5 KWH battery pack, inverters, solar panels + charge controllers (the solar was actually the most rinkydink and seems like it was bolted on as an afterthought; it can be ignored), and a computer that would automatically start a Kubota generator to keep the batteries topped up (if the solar wasn't doing the job, obviously).

As I said before, Current will flow from the generator of the higher voltage to the generator of the lower voltage and a damage will happen to the two generators. That's because a generator is supposed to produce current, Not to draw ...

Parallel standby power systems have always been significantly advantageous over single large generator units. However, implementation of such systems has historically been limited to large projects or mission critical applications due to the constraints of higher cost, space, and the high level of complexity involved to setup and maintain.

However, make sure that both generators are inverter generators. To connect two parallel capable generators successfully, you will need a parallel kit. Power kits come with six terminals, four of which are power connectors. The other two are ground connectors. You should connect the ground cables to the generator's ground.

It is important that hybrid inverter maximum AC input current limit user setting is set before connecting generator. If inverter's AC input current limit is set too high, based on wattage spec of generator, when inverter syncs and closes connect relay to generator, the inverter can jump on genertor with a load up to the max limit setup on the ...
