Sachin i have modelled fuzzy, but i not aware how to connect it to capacitor bank .my model consists of 220kV 100MVA, a transformer and then i have to connect capacitor bank and a fuzzy output, please help. kash on 25 Oct 2012.

You may model both capacitors and reactors. The reactors should be specified first, in the order in which they are switched in, followed by the capacitors, again in the order they are switched in. The sign convention is such that capacitors are positive and reactors negative. Shunt blocks are switched in order from left to right.

The reactive power flow is controlled by installing shunt compensating devices (capacitors/reactors) at the load end bringing about proper balanced between generated and consumed reactive power. On power systems, capacitors do not store their energy very long--just one-half cycle. Each half cycle, a capacitor charges up and then ...

Where f_1 is phase shift without capacitor and f_2 is phase shift with capacitor The capacitor is a receiver composed of two conductive parts (electrodes) separated by an insulator. When this receiver is subjected to a sinusoidal voltage, the current and therefore its power (capacitive reactive) is leading the voltage by 90° .

I found an old answer that said there are different kinds of capacitors for some insane reason. But my search turned up exactly one kind, the kind I used. I don't want a variable capacitor. Just a plain old simple capacitor. So how do I get the right kind? I want the kind that has a capacitance, like in the link.

A shunt is a device that is designed to provide a low-resistance path for an electrical current in a circuit is typically used to divert current away from a system or component in order to prevent overcurrent. Electrical shunts are commonly used in a variety of applications including power distribution systems, electrical measurement systems, automotive and ...

The slope of the crystals impedance above shows that as the frequency increases across its terminals. At a particular frequency, the interaction of between the series capacitor C_s and the inductor L_s creates a series resonance circuit reducing the crystals impedance to a minimum and equal to R_s . This frequency point is called the crystals series resonant ...

When the model represents a shunt mode connection, connect Port 1 to your power network and leave Port 2 open. Alternately, you can connect Port 2 to our network and leave Port 1 open, it will give the same result. ... If you make sure that the connection of the capacitor model follows the above guidelines, the simulator will take ...

This circuit is built with a resistor and capacitor. Here, the connection of the capacitor "C" is in shunt with the "RL" load resistor. Whenever AC voltage is applied to the circuit throughout the positive half cycle, then the diode lets the flow of current through it. We know that the capacitor gives high-resistive lane to DC ...
