Remember that all solar thermal collectors must be mounted with a slight pitch towards the supply end, so that you can drain them for maintenance. An inch for every 8 feet of run is sufficient. This is critical in drainback systems, so you should exaggerate the pitch by doubling the normal figure (an inch for every 4 feet of roof run).

Solar collectors are big, heavy pieces of equipment which are both very tough and very fragile at the same time. They weigh 85-140 pounds per collector (38-64 kilos) and are usually shipped on a pallet carried by a big rig truck. So how are you going to get them safely onto the roof of your house?
