Introduction. Various resources state that the optimal method of charging a li-ion cell -- such as one found in a mobile phone -- is to charge at a constant current (usually $< 1C$) until a certain voltage threshold is reached, then switch to charging at a constant voltage until the charging current drops to about $0.1C$, at which point the battery is fully charged.

How to control the current of lithium battery voltage

The common battery parameters, such as the battery voltage, battery temperature and cell voltages can be monitored via Bluetooth using the VictronConnect app. However, state of charge monitoring is not built into the battery. To monitor state of charge use the Lynx Smart BMS or add a battery monitor such as a BMV or a SmartShunt to the system.

Before starting to charge, first detect the battery voltage; if the battery voltage is lower than the threshold voltage (about 2.5V), then the battery is charged with a small current of C/10 to make the battery voltage rise slowly; when the battery voltage reaches the threshold voltage. At this stage, it enters constant current charging.
