For a given capacity, C-rate is a measure that indicate at what current a battery is charged and discharged to reach its defined capacity. A 1C (or C/1) charge loads a battery that is rated at, say, 1000 Ah at 1000 A during one hour, so at the end of the hour the battery reach a capacity of 1000 Ah; a 1C (or C/1) discharge drains the battery at ...

Choosing the Right Battery Balance Current for Different Applications. To determine the appropriate balance current for a specific application, key factors such as pack size, leakage current, and available balancing time must be considered. Here are some general rules of thumb to estimate the required balance current for Li-Ion packs in various ...

Another category of line protection is the current-only scheme. This category includes phase comparison and current differential relays. In a phase comparison scheme, the operating signal is the local current. Polarities of the local and remote currents are exchanged and compared using a communications channel to determine if the fault is internal.
