Battery electric vehicles (often called BEVs) have a powerful electric traction motor to replace the internal combustion engine, and no fuel pump, fuel line or fuel tank. It therefore has no exhaust or tailpipe, and so no "tailpipe emissions" (a key statistic used to rate the emissions or otherwise of other vehicle types).

Battery pack: Also referred to as a traction battery, it stores energy and supplies power and energy to the electric motor; the battery pack includes an array of physically connected battery cells and battery management hardware and software. This high-voltage battery is very different from a vehicle's 12-volt battery that powers lighting and instrumentation systems.

So, buckle up as we explore the power within electric vehicles. The Evolution of Electric Vehicle (EV) Batteries. The story of the EV battery has its roots in the 19th century, but it's in the last two decades that the real magic has happened. Nickel-Metal Hydride (NiMH) batteries were the stars of early electric vehicles.

In 2020, the weighted average range for a new battery electric car was about 350 kilometres (km), up from 200 km in 2015. The weighted average range of electric cars in the United States tends to be higher than in China because of a bigger share of small urban electric cars in China. The average electric range of PHEVs has remained relatively ...
