The cycle life and efficiency of a battery pack get enhanced by employing an intelligent supporting system with it called the Battery Management System (BMS).

Balancing Procedure. Use a multimeter or battery monitoring system to measure the voltage of each cell or module in the battery pack. Find a cell or module that has the highest as well as the lowest voltage reading. In passive balancing, use balancing resistors or shunt circuits to short the overcharged cells thus giving them time for discharge.

The active battery balancing method is an approach to equalize the SoC of the battery cells in a battery pack. In active balancing method, the battery having the highest SoC is made to equalize with the battery having the lowest SoC through the electronic circuits. However, it needs more cost and complex control circuits.
