The size and functionality of utility-scale battery storage depend upon a couple of primary factors, including the location of the battery on the grid and the mechanism or chemistry used to store electricity. The most common grid-scale battery solutions today are rated to provide either 2, 4, or 6 hours of electricity at their rated capacity.

An electric vehicle (EV) equipped with V2L could serve as a backup power source due to its large battery capacity, typically 70kWh, around double that of an average residential off-grid solar system. This large capacity allows EVs with sufficient V2L capability to store surplus solar energy and provide backup power when needed.
