Here, we report an aqueous manganese-lead battery for large-scale energy storage, which involves the $\text{MnO}_2/\text{Mn}^{2+}$ redox as the cathode reaction and PbSO_4/Pb redox as the anode reaction. The redox mechanism of $\text{MnO}_2/\text{Mn}^{2+}$...

Lead-acid systems dominate the global market owing to simple technology, easy fabrication, availability, and mature recycling processes. However, the sulfation of negative lead electrodes in lead-acid batteries limits its performance to less than 1000 cycles in heavy-duty applications.

Lead-acid batteries are prone to a phenomenon called sulfation, which occurs when the lead plates in the battery react with the sulfuric acid electrolyte to form lead sulfate (PbSO_4). Over time, these lead sulfate crystals can build up on the plates, reducing the battery's capacity and eventually rendering it unusable. Desulfation is the process of reversing sulfation ...

Lead-acid battery and manganese acid battery

The lead acid battery has been a dominant device in large-scale energy storage systems since its invention in 1859. It has been the most successful commercialized aqueous electrochemical energy storage system ever since. In addition, this type of battery has witnessed the emergence and development of modern electricity-powered society. Nevertheless, lead acid batteries ...

The lead acid battery uses the constant current constant voltage (CCCV) charge method. A regulated current raises the terminal voltage until the upper charge voltage limit is reached, at which point the current drops due to saturation. The charge time is 12-16 hours and up to 36-48 hours for large stationary batteries. With higher charge currents and multi-stage ...
