MIT startup, 24M, has designed an EV battery with a range of 1,000 miles on a single charge, reports Adele Peters for Fast Company. "The extra-long range also can help the car"s battery last much longer," explains Peters. "If you use a rapid charger to fully charge a battery, it can damage the battery, meaning it won"t last as long.

OverviewDesignHistoryFormatsUsesPerformanceLifespanSafetyGenerally, the negative electrode of a conventional lithium-ion cell is graphite made from carbon. The positive electrode is typically a metal oxide or phosphate. The electrolyte is a lithium salt in an organic solvent. The negative electrode (which is the anode when the cell is discharging) and the positive electrode (which is the cathode when discharging) are prevented from shorting by a separator. The el...
