

A lithium-titanate battery is a modified lithium-ion battery that uses lithium-titanate nanocrystals, instead of carbon, on the surface of its anode. This gives the anode a surface area of about 100 square meters per gram, compared with 3 square meters per gram for carbon, allowing electrons to enter and leave the anode quickly. Also, the redox potential of Li+ intercalation into titanium oxides is more positive than that of Li+ intercalation into graphite. This leads to fast charging (hig...

What are lithium titanate batteries? Lithium titanate, or lithium titanate oxide (LTO) batteries, are rechargeable batteries that use lithium titanate oxide as the anode material. These batteries fall under the lithium titanate classification. Their chemistry is based on the exchange of lithium ions between the cathode and the anode.

For solar and wind energy storage products like the Zenaji Aeon Battery, Lithium Titanate (LTO) is the most suitable battery chemistry. NMC and LiFePO4 battery solutions cannot be deeply discharged and have a life cycle of around 3,000 cycles before they fall below the 70% threshold. Thus, they last about 8 to 10 years in a solar system ...
