This results in higher temperatures in downstream cells compared to upstream cells, causing temperature non-uniformity in the battery module [37].

However, as the energy density of battery packs increases, the cooling efficiency of air cooling is insufficient to meet the heat dissipation requirements [11]. PCM utilizes the physical property of phase change, absorbing and releasing heat during the solid-liquid phase transition, which expands the limitations of active heating/cooling [13].

Hence, the use of PCM is gaining interest in the domain of electronic cooling, battery thermal management, building cooling, solar power generation systems, etc. [11, 12]. Several phase change materials (PCMs) are available in the market having a wide range of thermal conductivity, latent heat, heat capacity, and melting temperature.
