He patented the new "dry cell" battery in 1886 in Germany. These new dry cells, commonly called "zinc-carbon batteries," were massed produced and proved hugely popular until the late 1950s. While carbon is not used in the chemical reaction, it performs an important role as an electrical conductor in the zinc-carbon battery.

1. Intake stroke. The piston moves in the cylinder bore from the top dead center (TDC) to the bottom dead center (BDC).; The inlet valve is open, and the outlet valve is closed. The downward movement of the piston creates a vacuum (i.e., negative air pressure) that draws the air/fuel mixture into the engine through the open intake valve.

electric battery technology has ubiquitous applications. When connected to an external load, a redox reaction within the battery converts high-energy reactants into lower-energy products. This releases the energy difference to the external circuit as electrical energy. Initially, "battery" referred to a device of multiple cells.
