There are a wide variety of lithium battery chemistries used in different applications, and this variability may impact whether a given battery exhibits a hazardous characteristic. Lithium batteries with different chemical compositions can appear nearly identical yet have different properties (e.g., energy density).

Here the authors report that, when operating at around 60 °C, a low-cost lithium iron phosphate-based battery exhibits ultra-safe, fast rechargeable and long-lasting properties.

Abstract: Lithium iron phosphate batteries (LiFePO₄) are becoming one of the main power resources for electric vehicles (EVs), and the non-uniformity of cells in a battery pack has become the bottleneck to improve battery usable capacity. Many active balancing approaches are proposed to transfer charge among the cells to achieve the uniformity based on terminal voltage.
