The type of chemical reaction used determines the voltage of the battery, but for most commercial batteries the voltage is about 1.5 V per chemical section or cell. Batteries with higher voltages contain multiple cells inside connected together in series. Now you know why there are 3 V, 6 V, 9 V, and 12 V batteries, but no 4V or 7 V batteries.

Lithium batteries are manufactured as button and coin cell for a specific range of applications (like watches, memory backup, etc.) while larger cylindrical type batteries are also available. The following table ...

3LR12 (4.5-volt), D, C, AA, AAA, AAAA (1.5-volt), A23 (12-volt), PP3 (9-volt), CR2032 (3-volt), and LR44 (1.5-volt) batteries (Matchstick for reference). This is a list of the sizes, shapes, and general characteristics of some common primary and secondary battery types in household, automotive and light industrial use.. The complete nomenclature for a ...

Although lithium batteries are available in various shapes and sizes, the coin-type cells are the most popular. They are also capable of replacing ordinary alkaline cells in devices such as cameras. On a different note, lithium batteries pose a much greater threat to the environment and human health than most other battery types.

There are also two different voltages of RV batteries, though most motorhomes, campers, and trailers operate on 12 volt systems. The battery technology that is commonly used for both gasoline and diesel powered vehicles is lead acid. These batteries operate by having a number of lead plates suspended in an acid solution.

The standard type of battery in most automobiles is an SLI, which stands for starting, lighting, and ignition. It's a wet cell battery that charges quickly and delivers 12.6 volts to the starter, which helps get it going. This battery is also responsible for powering your headlights, interior lights, and entertainment system.

Lithium batteries have several advantages over other rechargeable batteries: They have higher energy density than other types of rechargeables (meaning they can hold more charge in a given volume), they're lighter and more compact than similar lead-acid or nickel-cadmium cells, and they don't degrade as much over time as older ...
