A solar module comprises six components, but arguably the most important one is the photovoltaic cell, which generates electricity. The conversion of sunlight, made up of particles called photons, into electrical energy by a solar cell is called the "photovoltaic effect"; - hence why we refer to solar cells as "photovoltaic", or PV for short.

The solar panels that you see on power stations and satellites are also called photovoltaic (PV) panels, or photovoltaic cells, which as the name implies (photo meaning "light" and voltaic meaning "electricity"), convert sunlight directly into electricity. A module is a group of panels connected electrically and packaged into a frame (more ...

The first semiconductor p-n junction solar cells were described in 1941 by Russel Ohl of Bell Laboratories [6]. These junctions formed naturally in slowly solidified melts of silicon (Fig. 4). Exploration of their properties led to the understanding of the role of p- and n-type dopants in controlling semiconductor properties and hence to the microelectronics ...

Photovoltaic cells are semiconductor devices that can generate electrical energy based on energy of light that they absorb. They are also often called solar cells because their primary use is to generate electricity specifically from sunlight, but there are few applications where other light is used; for example, for power over fiber one usually uses laser light.

Direct sunlight is the most beneficial condition for optimal production by your solar panels, but other low-light conditions may affect the panel's performance.
