Solar energy is the light and heat that come from the sun. To understand how it's produced, let's start with the smallest form of solar energy: the photon. Photons are waves and particles that are created in the sun's core (the hottest part of the sun) through a process called nuclear fusion.

Applications of photocatalysis have expanded rapidly especially in energy and the environment in the last four decades. The word "photocatalysis" is comprised of two parts: the prefix "photo," which means "light," and "catalysis," which is the process to decompose a reactant using a catalyst that modifies the rate of a chemical reaction [6], [7].
