Let's do a quick myth buster: there is a common belief that lowering the charge voltage to 13 volts or lower will decrease the need to check the water levels as often. While this is true, it can also lead to battery stratification - which causes the battery acid to separate from the electrolytes and collect at the bottom of the battery.

You may also notice that the battery voltage is low or that the battery is swollen. How long does it take for sulfation to occur in lead-acid batteries? Sulfation can occur in lead-acid batteries over time, but the rate at

As a lead acid battery owner, you must know the details of acid stratification. Causes of Acid Stratification. As you know, lead acid battery electrolyte is a mixture of water and sulfuric acid. Sulfuric acid is heavier than water. So, when the battery is not in use, the acid tends to settle down at the bottom of the cell.

Lead Acid. The nominal voltage of lead acid is 2 volts per cell, however when measuring the open circuit voltage, the OCV of a charged and rested battery should be 2.1V/cell. Keeping lead acid much below 2.1V/cell will cause the buildup of sulfation. While on float charge, lead acid measures about 2.25V/cell, higher during normal charge. Nickel ...
