

Relationship between energy storage battery capacity and energy

An advanced battery management system (BMS) is necessary to ensure the safe and efficient operation of LIBs in the way of monitoring battery [3,4]. State of charge (SOC) and State of energy (SOE) are two important monitoring parameters in BMS, since SOC determines remaining capacity and SOE determines remaining energy.

The space between its plates has a volume Ad , and it is filled with a uniform electrostatic field E . The total energy (U_C) of the capacitor is contained within this space. The energy density (u_E) in this space is simply (U_C) divided by the volume Ad . If we know the energy density, the energy can be found as ($U_C = u_E(Ad)$).

Coulombic efficiency (CE), as a battery parameter to monitor the magnitude of side reactions, has been of great interest in recent years [4]. CE is defined as: $\eta = \frac{C_d}{C_c}$, where C_d is the discharge capacity of a cell at a single cycle, and C_c is the charge capacity of the cell in the same cycle. Theoretically, when a cell is free of undesired side reactions, its CE ...
