A fuel, such as hydrogen, is fed to the anode, and air is fed to the cathode. In a polymer electrolyte membrane fuel cell, a catalyst separates hydrogen atoms into protons and electrons, which take different paths to the cathode. The electrons go through an external circuit, creating a flow of electricity.

The last several years have witnessed the prosperous development of zinc-ion batteries (ZIBs), which are considered as a promising competitor of energy storage systems thanks to their low cost and ...

Text version of the fuel cell animation that demonstrates how a fuel cell uses hydrogen to produce electricity.

The battery discharges (gives up a little of its energy) to help the car's gasoline engine start up, and recharges (gets energy back again) when the engine begins generating electrical energy through a device called an ...

Lithium batteries are most afraid of over-discharge. Once the discharge voltage is lower than 2.7V, it may cause the battery to be scrapped. Fortunately, a protection circuit has been installed inside the mobile phone battery. The voltage is not low enough to damage the battery, and the protection circuit will work and stop discharging.

To further improve the energy storage performance, a new electrochemistry of deposition reaction has been proposed for Zn-MnO2 batteries, which endows MnO2 cathodes with an ultra-high ...

battery, including: Coulomb counting is a method used by the BMS to estimate the SOC of a battery. It involves measuring the flow of electrical charge into and out of the battery over time. Coulomb counting requires a current sensor to measure the current flowing into or out of the battery, and the BMS calculates the SOC by integrating the
