Platinum Tools has updated its EZ-RJ45 shielded Category 5e and Category 6 connectors with internal or external ground. The connector simplifies twisted-pair terminations, Platinum Tools says, by allowing the wires to be inserted through the connector and out the front, which easily verifies the proper wiring order. By pulling the connector down over the cable ...

A method and apparatus is provided for shielding a capacitor structure formed in a semiconductor device. In a capacitor formed in an integrated circuit, one or more shields are disposed around layers of conductive strips to shield the capacitor. The shields confine the electric fields between the limits of the shields.

After some thought and research, I settled on metallized polyester film capacitors rated at 630 volts. I chose 0.0047 μ F to replace the 0.005 μ F waxies, 0.047 μ F in place of the 0.05 μ F ones, and 0.022 μ F in place of the lone 0.02 μ F capacitor ...

Because of the huge increase in capacitance when shielded wire is used, the capacitive lag caused by using shielded wire can corrupt the intended signals. The shielding is an unintended capacitor. Before using shielded wire, consult with the equipment manufacturer to know if shielding should be used. Douglas Krantz

where l : length of the shielded cable Expressing the shield current, I_{shield} : $I_{\text{shield}} = V_{\text{cm}} / Z_{\text{loop}}$ We can replace V_d by its value in the expression of K_r : $K_r = Z_t \cdot l / Z_{\text{loop}}$ Z_{loop} itself is a length-dependent term, since it is simply the impedance of the shield-to-ground loop, which for any decent shield is a lesser value than that of the ...

The deco item that is an orange ridge box I think is called a capacitor, and many have suggested it to be converted into a +1000 or 500 shield points increase. Some want surge charge packs made of pentaxid that are put into the main generator, but would require being able to walk around on a moving ship.

Some non-electrolytic capacitors have a banded end, occasionally labeled "outside foil". These capacitors are typically made by taking a long narrow strip of insulating material and placing a strip of metal foil on both sides of it. The two pieces of foil become the plates of the capacitor, and the insulator is the dielectric.
