Among the different available possibilities, sodium-ion batteries (NIBs) are of special interest given the redox potential of  $E(\text{Na}^+/\text{Na}) = -2.71 \text{ V}$  of sodium, the natural abundance of sodium (2.36% in Earth's crust), its low price of  $0.15 \text{ \$ kg}^{-1}$ , and the possibility of using aluminum current collectors (instead of the copper/aluminum required for LIBs).

energy production. While other technologies: 1. like demand-side flexibility that can reduce, increase or shift the demand within a specific duration may provide flexibility within the grid, the use of energy storage systems remains the preferably solution capable of providing the critical energy shifting service required to minimize renewable energy curtailment. Among the ...

Sodium-ion batteries contain sodium-based electrodes and (typically) liquid electrolytes with dissociated sodium salts in solvents. When these batteries are charging, sodium ions travel from the cathode into the anode, and the electrons travel through the external circuit. Discharging reverses the process, with sodium ions traveling from the anode and ...
