Low profile mounting requires additional check valve closed-loop system; heat transfer fluid (water or anti-freeze solution) circulates through the system's tubes without mixing with ...

The most important thing to consider while designing the exhaust piping system is the back pressure on the turbocharger. The back pressure in the exhaust gas system at specified Maximum Continuous Rating (MCR) of engine depends on the gas velocity, and it is inversely proportional to the pipe diameter to the 4th power.

Breathing diesel engine exhaust exposes you to chemicals known to the State of California to cause cancer and birth defects or other reproductive harm. Always start and operate the engine in a well-ventilated area. If in an enclosed area, vent the exhaust to the outside. Do not modify or tamper with the exhaust system.

A more serious reason for coolant coming out of your exhaust is because of a cracked or warped head. The coolant or antifreeze escapes in a similar way as if it were a blown head gasket, but instead of coming through the cracks in the gasket, it actually comes through the cracks in the head.

A faulty solar hot water anti frost protection valve (FPV) will leak water from one corner of the solar collectors. The actual panels are usually fine with no visual cracks or wet patches underneath. This can be a common fault for many Australian solar hot water heater systems as the winter sets in each year. So why an

recommended valve location. DO NOT install a single height control valve of any type if the suspension or vehicle manufacturer specifies a two (2) height control valve system. DO NOT use antifreeze or other solvents in air supply line. Use of solvents or antifreeze can damage seals and voids the valve warranty. ALWAYS use a Pressure Protection ...

#1 Air Compressor. The air compressor helps to suck atmospheric air into the storage tank or reservoir. It compresses the air to the desired pressure and transfers it to the storage tank. An air compressor is driven by the engine using a belt drive. A compressor may be air-cooled or cooled by an engine cooling system. #2 Storage Tank

Hydronic heating systems must be filled with water to provide the heat transfer fluid (HTF) that makes them work. In the case of the closed-loop solar heating system, the HTF is typically a mixture of water and propylene glycol. The process of filling the plumbing system with this antifreeze while purging all the air out must be done ...

Regularly inspect the system: Regular inspections of the coolant system can help identify and address issues before they become more significant problems. By following these recommended maintenance tasks and tips, you can keep your 5.9 Cummins engine"s coolant system in top shape and avoid costly repairs. Cummins Low Flow ...

consists of four main parts -- the solar collectors, the solar pump station, the solar storage tank, and the plumbing for the heat transfer fluid. The solar pump station uses a pump to circulate a heat-

An adequate quantity of coolant and cooling air must be able to pass through the pipes and radiator. Connecting components or restriction valves in the system reduces the amount of coolant passing through the radiator and thereby reduces the cooling capacity. At the same time, this increases the pressure in thermostat housing, hoses and cooler.
